

Pro Zig Zag Highbanker

\$810.00 USD

Total weight: 30 lbs.

Total dimensions: 16" wide (at legs) x 30" tall
(working height with raised legs)

Sluice Box: 34" long x 12" wide x 4.5" tall

SET UP:

Raise the top header unit to the desired height, and slide bolt into the desired hole and tighten wing nut to secure in place. Next raise middle section and slide bolt into desired hole and tighten wing nut. Raise highbanker and adjust legs to correct height and angle for sluice. Raise highbaker from front to back and level from side to side. Hook up water supply and adjust water flow with shut off valve.

HOW IT WORKS:

Material is placed into the upper hopper, where the spray bars wash the material. The material then drops down onto the grizzly area. The classified material will drop down and the washed rocks will fall out. From there the washed material drops into the top of the sluice box and gets washed through the riffles.

Processing a five gallon bucket should take about 4-5 minutes.

By washing the material for a longer time, our unique zig zag design helps you capture more gold!

OUR MISSION: To make the gold prospecting experience more productive for small scale miners.
